

Platform documentation (complete edition)

This single file merges all guides for PDF export. Editable sources: `README.md`, `CLIENT\_USER\_GUIDE.md`, `QA\_TESTING\_GUIDE.md`, `ROLES\_AND\_PERMISSIONS.md`.

Part 1 - Overview

English documentation for the e-commerce / retail operations web application (Angular frontend + Node.js/MongoDB backend).

- Section · Audience · Purpose ·
- Part 2 · Store staff, managers, clients · Day-to-day usage ·

· Part 3

Product scope (high level)

- Multi-branch retail: products, categories, stock, transfers, sales (orders/invoices), cash desk, customers, suppliers, purchasing requests.

- Report

Technical references

- Frontend routes: `frontend/src/app/main/main-routing.module.ts`

- Sideba

Part 2 - Client user guide

This guide explains what the system is for and how to use each main area (end users: store staff and managers).

1. Signing in and account security

- Open the application URL provided by your administrator.

- Sign in

Interface language: Switch where the app exposes a language control.

Receipt

2. Home dashboard

- Available to Super Admin (as configured in routing).

- High-le

3. Products

Purpose: Product catalog: codes, pricing, discounts, categories, branch assignment, stock, images, booking options where enabled.

Typical tasks: Create/edit products; barcode/QR; bookings (deposit, customer, pickup/shipping); notifications on confirmation.

Notes: Some roles are branch-scoped; Moderator may be view-only with booking as allowed.

4. Categories

Group products; short codes often prefix product codes. Create categories before bulk coding if prefixes are required.

5. Branches

Store locations; operational fields (rent, salaries, branch invoices, expenses) feed profit where entered. Access: Super Admin, Co Admin, Warehouse (not Branch Manager in default menu).

6. Inventory

Stock and transfers between warehouse and branches; movements as implemented. Bookings may reserve units.

7. Users

Staff accounts: role and branch. Global admin roles may not be tied to one branch. Access: Super Admin, Co Admin.

8. Store settings

Store name, phone, logo, receipt language. Access: Super Admin, Co Admin.

9. Cashier

Point of sale: lines, discounts, payment, print. Receipt follows receipt language / logo settings.

10. Orders

Orders/invoices outside quick cashier path per your process.

11. Clients

Customer directory. Access: Super Admin, Co Admin, Branch Manager.

12. Suppliers

Supplier records. Access: Super Admin, Co Admin, Branch Manager.

13. Purchasing

Purchasing requests. Access: Super Admin, Co Admin, Branch Manager.

14. Reports

- Report · Purpose ·
- Sales · Revenue, orders, trends, payment mix ·
- Profit

Use date range and branch filters; export per screen.

15. Audit log

Who did what, when. Access: Super Admin, Co Admin.

16. Vixa (AI)

Natural language questions; sales, profit, bookings and date ranges. Answers respect your permissions. External AI/search may be unavailable-internal numbers may still work.

17. Notifications

In-app alerts (e.g. bookings); mark as read.

18. Getting help

Administrator for accounts and branches. For numbers: check date range, branch, and branch cost fields for profit.

Part 3 - QA testing guide

1. Test environments and data

- Topic · Recommendation ·
- Environments · Staging with realistic subset of production data ·
- Users

2. Role × module matrix (smoke)

- Area · Super Admin · Co Admin · Branch Manager · Warehouse · Cashier · Moderator ·
- `/home` · ✓ · X · X · X · X · X ·
- Produ

Deep checks: ProfitReportGuard redirects Co Admin / Branch Manager from `/reports/profit` to `/reports/sales`. Branch isolation for non-global roles. Legacy Operation Manager = Warehouse.

3. Authentication & session

Login, logout, password update, deep-link denial for forbidden routes.

4. Core commerce flows

Products & categories: CRUD, validation, code prefix rules, image upload.

Inventory

5. Reports

Each type: empty state, dates, branch filter, export. Profit: branch overhead fields and net vs trading profit; no profit for Co Admin / BM (UI + Vixa).

6. Purchasing & master data

Suppliers, purchasing requests, clients.

7. Settings

Persist name, phone, logo, receipt language; reflect in UI and prints.

8. Audit log

Verify entries for sensitive actions.

9. Notifications

Booking triggers; read/all read; no duplicate errors.

10. Vixa API

- # · Case · Expectation ·
- 1 · "sales today" EN/AR · Summary, sales intent ·

· 2 · A

UI: floating widget vs full `/vixa` page.

11. API smoke

Endpoints under `/api/\*` as in `bootstrap.js`; unauthenticated access blocked; AI rate limit if enabled.

12. Non-functional

i18n, RTL, performance, security.

13. Regression buckets

Login/roles → product/order/print → inventory/booking → reports/profit → settings/receipt → notifications → Vixa → audit.

Part 4 - Roles and permissions

Role-based access: UI and backend both enforce rules.

- Role · Notes ·
- Super Admin · Full access including `/home` and profit report; global branch filters. ·

· Co A

Branch scoping: Super Admin and Co Admin often have global filters; others typically branch-scoped.

Profit: Co Admin / Branch Manager cannot open profit; Vixa denies profit tools for them.

Reports routing: Super Admin, Co Admin, Branch Manager, Warehouse - not Cashier/Moderator.

Vixa: Authenticated users can open; server enforces data permissions.
